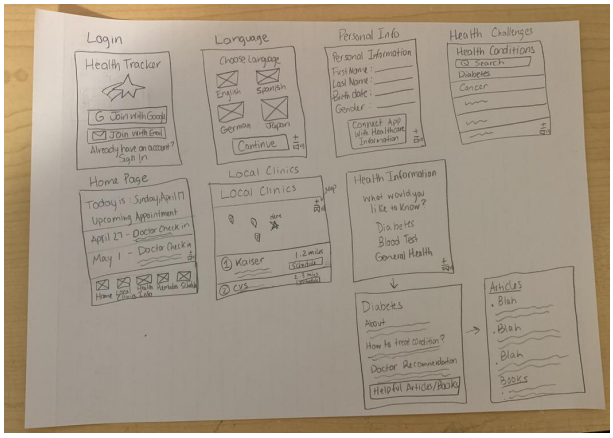
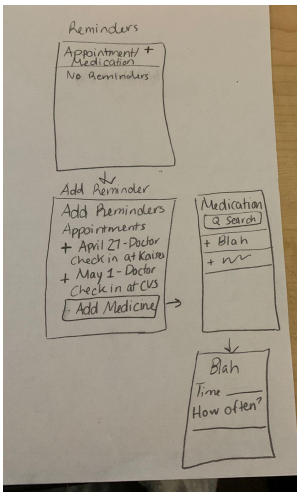
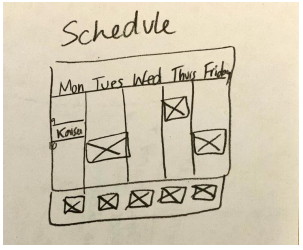
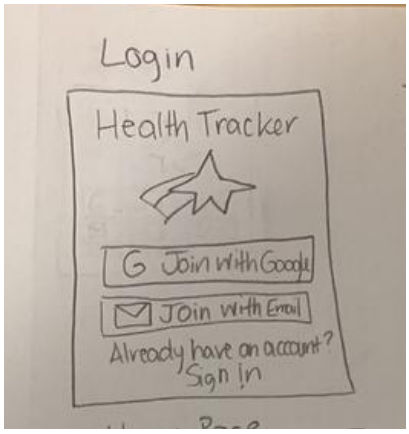
Part I: Full Hand-Drawn Prototype Sketch

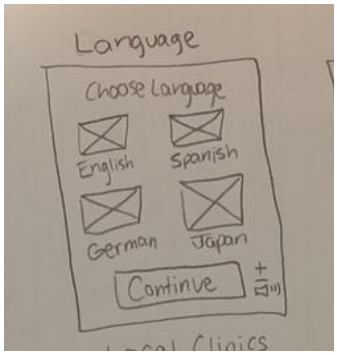




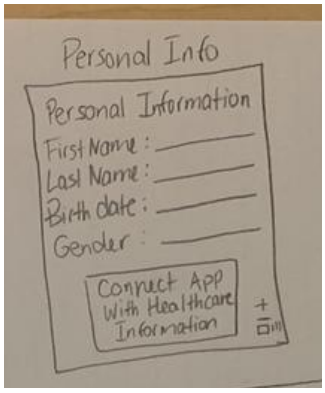




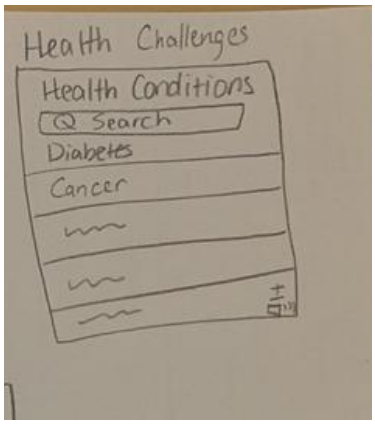
Login Page: Users can either create an account by connecting their already existing google account or other email account such as yahoo or AOL. Returning users can log in at the very bottom if they already have an existing account.



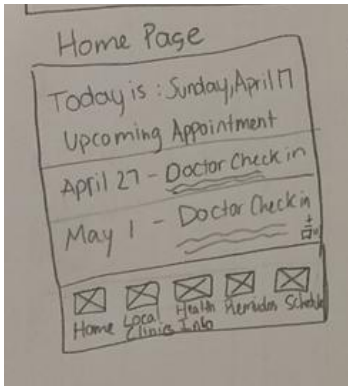
Language: Users can select their preferred language on this page.



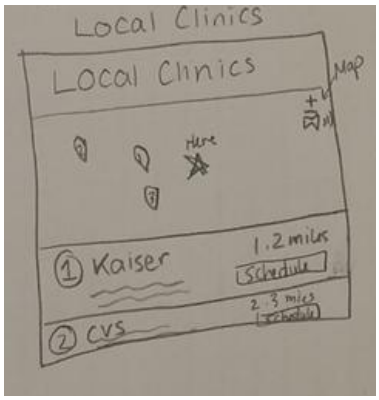
Personal Info: Stored info such as first name, last name, birthdate, etc. can be found here. Users also have the option to connect the application with their existing health and personal records.



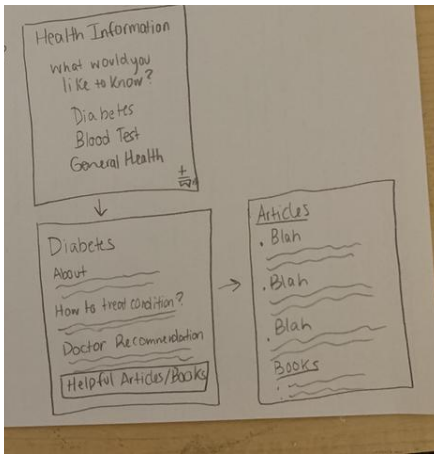
Health Conditions: When user is utilizing this app, they can select if they choose not to connect with their healthcare app with what conditions they would like more research and/or information on.



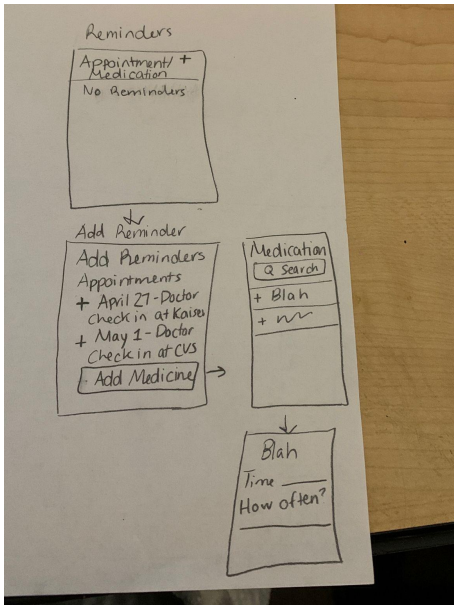
Home Page: When the user is already logged in this will be the first page that they will see. It will list the scheduled appointments the user has and the kind of appointment they have. There are also icons below that take you to the local clinics page, health info page, reminders page, and calendar page.



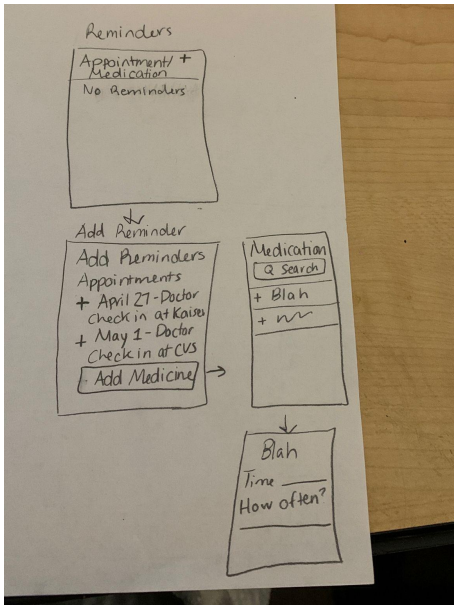
Local Clinics: This page allows the user to locate nearby health clinics and providers in their area. They will be given the name, contact information, as well as a marker on a map to show where they are located.



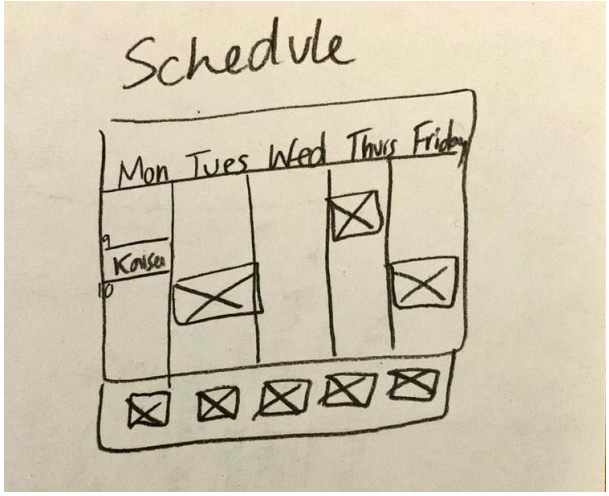
Health Information: This page contains the user's health information and diagnosis. This can be updated by either the user or their health care provider. In this section, we will also be providing scientific proven articles and book recommendations to users with health condition such as treatment and remedies can be found on these pages.



Reminders: This page lists reminders of any scheduled, late, or canceled appointments. This can be accessed by both the user or the healthcare provider in case any unforeseeable changes need to be made.



Medication: Users can input the medication that they are prescribed to take and list the amount of dosage to take. They can use the search bar to find the right medication prescribed as well as find a pickup place.



Schedule: A full calender of planned check ups listing the date, time, and location of the appointment.

Part II:

- **Are you planning on making a mobile, web, physical prototype?**
    - We are planning to make a mobile application prototype. The app is designed for users to create,check, and review their health assessments/appointments. The app is centered around simplicity and essentially making the user's experience with healthcare applications easier.
- **Who is responsible for what parts of your prototype?**

  Abhash - Language, Login Info, Reminders, Schedule

  Segen - Personal Info,Home Page, Articles

  Ramseii - Local Clinics,Health Information, Medication

- **In addition, feel free to describe any challenges that you are facing in your project.**
    - The challenges we are facing with the project is trying to outline the healthcare information and reminders. Since it is a little more to it then the other drawings we have done. In the future, some of our

designs might have to be fixed in order to make sure the prototype is easy to use and accessible to diverse groups.
