06 Final Thoughts

Brainstorming

We each thought up a problem, that occurs in our daily life or someone else's daily life that negatively impacted health and could have long lasting effects.

Problem 1: Having trouble making or keeping track of appointments for all age groups.

Problem 2: Overusing blue light technology, and how it negatively impacts future eyesight.

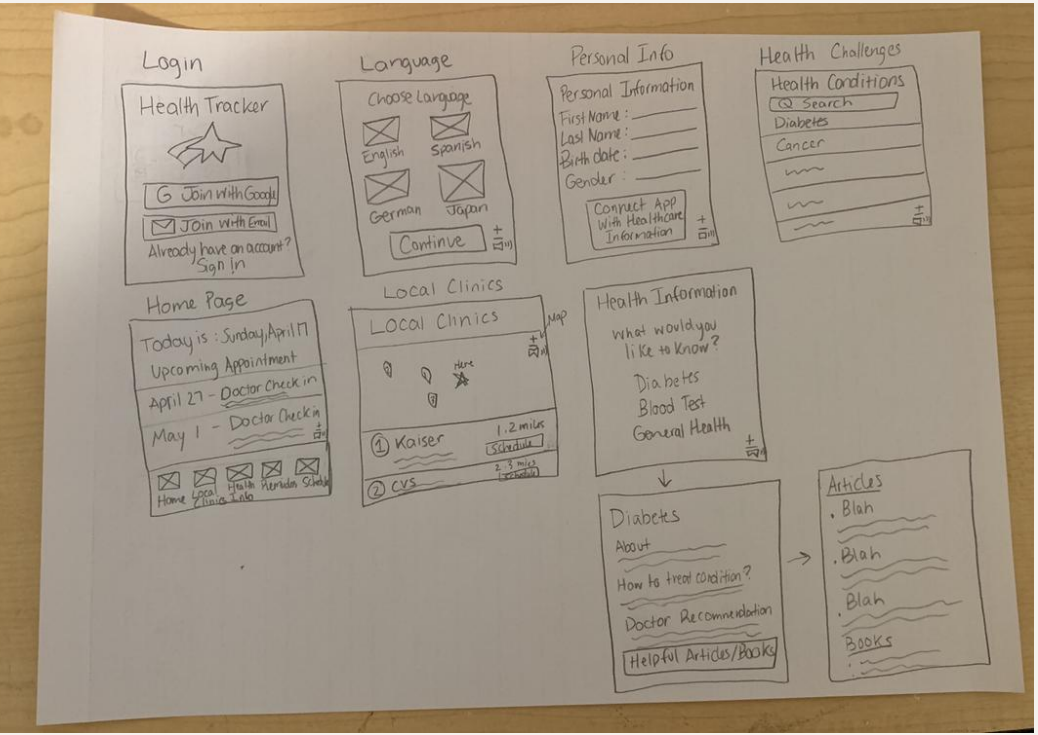
Problem 3: Eyesight website and application for the visually impaired.

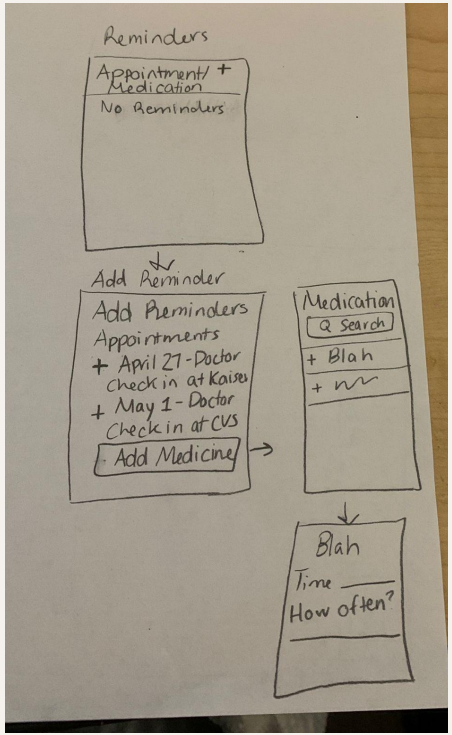
Idea Generation

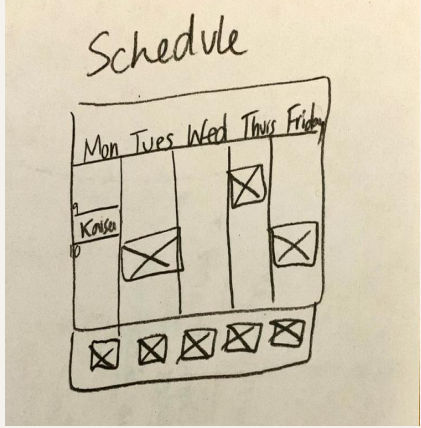
While we believed that during our brainstorming of which problem to take on we believed that problem #1 was the easiest and realistic problem we could tackle and come up with a solution.

- We decided to make it an application since we wanted people/patients to use this on the go.
- We wanted to make this application accessible to everyone no matter the age group
- When looking at our competitors or similar applications we decided to add more functions such as the healthcare locator function or health information page.

Our Low-Fidelity Prototype Map

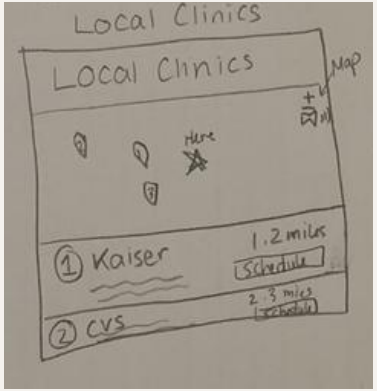




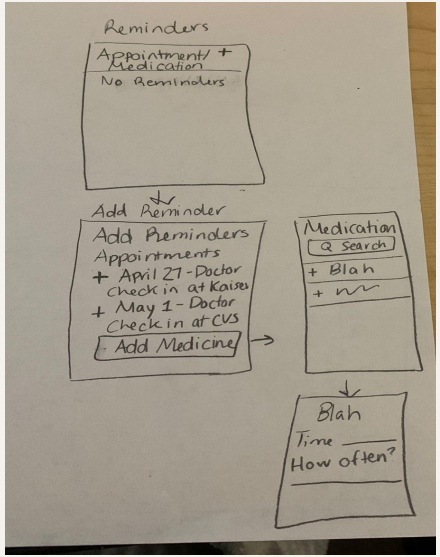


Main components of Low-Fidelity Prototype

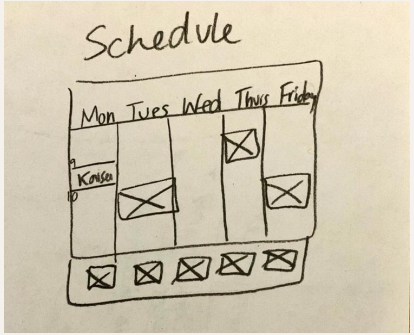
1) Clinic Finder



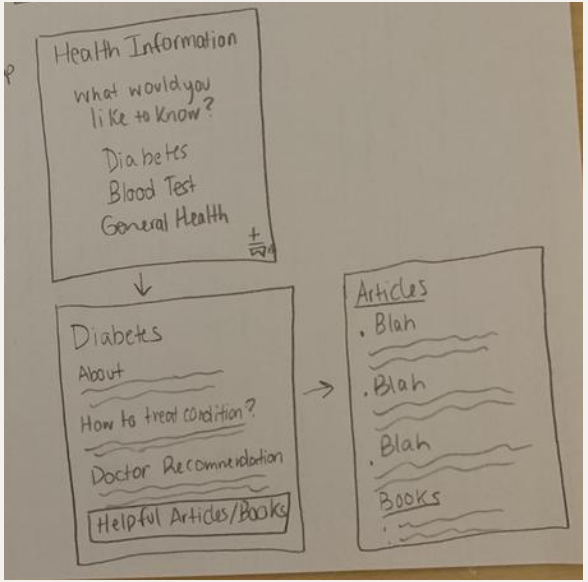
2) Reminders



3) Schedule



4) Health Information



Our High-Fidelity Prototype Map

Competitive Analysis

- There were many health apps that had similar ideas as us such as the ability to create appointments, search for health physicians, etc. Our design will be different than our competitors due to the very simple UI design as well as implementing the ability for users to further their knowledge on their health by having links/resources that will be helpful to learn about their health issue or their blood work.

#1: MyUPMC

- This app allows patients to schedule appointments to their provider, access medical records, see test results as well as add appointments to calendar, and renew prescriptions without calling doctor's office.

- How can your solution do better?
We plan on making the UI simple as well as providing explanation of test results and health habits that the patient can implement into their everyday life. Their app also does not have the option to hear text or have text viewed bigger as well as translate text which our app will be having in our interface.

#2: HealthTap

- This app is allow users to schedule appointment, save money on prescriptions, and free text your doctor anytime with any request on refills, clarifying health goals, and to ask questions. They also allow you to view lab test.

- How can your solution do better?
We will not be charging the users of our app and also share ways on how to save on prescriptions if they can.

#3: HealthSynch

- This app is a tool that allows love ones to collaborate on tracking and sharing health information. It creates a dataset in order to help manage medication, doctor appointments, etc.

- How can your solution do better?
We will do better by implementing health information resources to their medical issues in order for the elderly to independently research for their condition as well as easily make their own appointments.

Rationale for Design Decisions

Rationale for design decisions or features you chose to support with prototype

- Simple design to make app user friendly
- Information with links to articles for credibility
- Language options for non-english speakers to make the app user friendly
- Person profile options to make the app more user-centered

Final Thoughts

Final thoughts: Reflect on the process, the design. What was the good, the bad, and the ugly?

- Simplistic design
- Hard to fit information on one screen
- Minimizing the amount of options
- Simple but effective overall concept

Thank you
